(54) MODULATOR AND DEMODULATOR FOR OFDM WAVE

(57) Abstract:

PURPOSE: To detect a peak of an OFDM wave, to suppress the peak and to transmit peak suppression information superimposed on transmission information in an OFDM modem.

CONSTITUTION: This modem is equipped with an IDFT arithmetic circuit 1, and a peak detection circuit 2 which allocates a frequency to the transmission information and detects the peak over a prescribed value from an IDFT calculation result, and a calculation result is transmitted to the next step as it is when no peak is detected, and when the peak over the prescribed value is detected, the level of a peak negative signal is decided from a peak value by a peak negation circuit 4, and a part at which the peak is generated and the level information of the peak negative signal are added to a specific carrier, and IDFT- calculated with the transmission information again, and the peak negative signal with a code different from that of the peak is superimposed on the part of the calculation result at which the peak is generated and the result is sent.

LEGAL STATUS

28. 03. 2001
